

MUNCHIESKK

Made With Love To Satisfy Your Hunger

PRODUCT REQUIREMENTS DOCUMENT

Product	MunchiesKK — Web Ordering, Loyalty & Engagement Platform
Business	MunchiesKK Burger Stall, Penampang, Sabah, Malaysia
Prepared by	Ali (Founder / Product Owner)
Document status	Draft v1.0 — Phased Roadmap
Build approach	Solo, no-code / low-code implementation
Target MVP launch	August 2025, aligned to stall opening

Table of Contents

1. Document Control & Revision History
2. Executive Summary
3. Business Context & Problem Statement
4. Goals, Non-Goals & Success Metrics

8. Phase 2 Feature Specifications — Loyalty Points
9. Phase 3 Feature Specifications — Arcade & Gamification
10. Cross-Cutting Requirements (CRM, Stock, Payments, Compliance)
11. Technical Approach for a Solo No-Code Build
12. Risks, Assumptions & Open Questions
13. Roadmap & Timeline
14. Appendix — Menu Reference

1. Document Control & Revision History

This document is a living artifact. As the MVP ships and real order data comes in, sections 8 and 9 (Loyalty and Arcade) should be revisited and re-scoped based on actual customer behaviour rather than assumptions made pre-launch.

Version	Date	Author	Change
0.1	26 Jul 2026	Ali	Initial draft covering full feature vision
1.0	26 Jul 2026	Ali	Restructured into phased roadmap (MVP / Loyalty / Arcade)

2. Executive Summary

MunchiesKK is a new burger stall opening in Penampang, Sabah, targeting an August 2025 launch. This PRD documents the full long-term vision for MunchiesKK's digital ordering and engagement platform — a website covering ordering (Home/Menu), a back-office CRM for stock and pricing, a customer loyalty program, and a gamified 'Arcade' engagement layer.

The original request bundled all of these into a single launch scope. As the founder's mentor on this document, the honest assessment is that this is too much to build and validate at once — especially given the stall itself has not opened yet, and the site will be built solo, without code. This document therefore reframes the vision into three phases:

Phase	Focus	Trigger to start
PHASE 1 — MVP	Home, Menu (Food/Drinks/Desserts), basic ordering, basic Profile, lightweight back-end for stock & pricing.	Immediately — required for stall opening.
PHASE 2 — Loyalty	Tiers, Prize Vault, Point History, Referral program.	After 60–90 days of live order data and a stable menu/pricing.
PHASE 3 — Arcade	3 gamified experiences tied to the points system.	Only after Phase 2 shows loyalty measurably improves repeat visits.

Why this matters: gamification and loyalty systems exist to retain and reward an existing customer base. Building them before a single burger has been sold means designing reward economics, tier thresholds, and game mechanics entirely on guesswork. That risk is called out explicitly, not hidden, throughout this document.

3. Business Context & Problem Statement

3.1 Business Snapshot

- New F&B; venture: burger stall in Penampang, Sabah, Malaysia.
- Founder has prior F&B; business experience; two experienced staff members onboarded.
- Menu fully costed and priced: Big G, Mushy2, and CZ Chix burgers; three fries variants; blended and canned drinks. Separate walk-in and GrabFood pricing already locked.
- Pre-launch checklist in progress: SSM registration, MPP Penampang trading licence, food handler certification, and Halal certification (flagged as the critical long-lead item).
- Target opening: August 2025.

3.2 Problem Statement

Walk-in and delivery-platform (GrabFood) customers currently have no direct, brand-owned channel to browse the menu, place orders, or engage with MunchiesKK outside of third-party apps. There is also no lightweight system for the founder to manage stock levels and pricing without editing a delivery platform's back-end separately from any owned channel.

3.3 Why a Website (and Why Not Yet an App)

A responsive website is the right first step for a single-location, pre-revenue stall: no app-store review cycles, no forced installs, and it can be built and iterated on solo using no-code tools. A native app should only be considered once there is a proven, repeat customer base — the same logic applied to gating Phases 2 and 3.

4. Goals, Non-Goals & Success Metrics

4.1 Goals

- Give walk-in and delivery customers a single branded place to view the menu and current prices.
- Let the founder update stock availability and pricing without touching code.
- Establish a foundation (customer accounts, order history) that Phases 2 and 3 can build on later.
- Keep Phase 1 buildable solo, with no-code tools, within weeks — not months.

4.2 Explicit Non-Goals (for Phase 1)

- No loyalty tiers, points, or referral system in Phase 1 — see Section 8 for why this is deferred.
- No arcade / mini-games in Phase 1 — see Section 9.
- No custom-built payment processor — Phase 1 relies on existing, proven gateways (see Section 10.3).
- No native mobile app.

4.3 Success Metrics by Phase

Phase	Metric	Target
Phase 1	Site live and usable before stall opening	Ready by Aug 2025
Phase 1	% of orders placed via site vs. purely walk-in/GrabFood	Track only — no target yet, this is baseline data
Phase 1	Menu/stock update time for founder	Under 2 minutes per item, no code required
Phase 2	Repeat customer rate before vs. after loyalty launch	Measurable lift required before Phase 3 greenlight
Phase 2	Referral-driven new customers	Tracked per referral code
Phase 3	Engagement time on Arcade tied to actual repeat orders (not just play count)	Positive correlation required to justify investment

Note: 'play count' or 'points earned' alone are vanity metrics. If Phase 3 ever launches, the metric that matters is whether playing the games measurably increases repeat visits or basket size — not engagement for its own sake.

5. Scope & Phasing Strategy (Read This First)

This is the most important section of the document. The original feature list — Home, Menu with CRM, a 3-game Arcade, a full Loyalty program, and a rich Profile — is a reasonable long-term vision. It is not a reasonable v1 for a single stall that has not opened yet, built solo with no-code tools. Section 5.1 maps every original feature to a phase and gives the reason.

5.1 Full Feature-to-Phase Mapping

Original Feature	Phase	Rationale
HOME — Mainpage / hero	Phase 1	Core to any ordering site; needed at launch.
MENU — Food / Drinks / Desserts (front end)	Phase 1	Core ordering function; needed at launch.
MENU — CRM back end (stock & pricing)	Phase 1 (lightweight)	Founder needs this to run daily operations, but v1 should be a simple admin panel, not a full CRM (see 10.1).
ARCADE — 3 gamified games with points	Phase 3	Requires an existing points system to reward, and real engagement data to justify build effort; also the hardest piece to build no-code.
LOYALTY — Tier / Prize Vault / History / Referral	Phase 2	Needs 60–90 days of real order volume to set sane tier thresholds and reward values.
PROFILE — Points, Personal Info, Order History	Phase 1 (partial) / Phase 2 (points)	Personal info, order history, payment methods, settings, logout are Phase 1. Points display activates in Phase 2.
PROFILE — Promo Codes	Phase 1	Simple promo code redemption is low-effort and independent of the loyalty engine.

5.2 Gate Criteria — When to Move to the Next Phase

- Phase 1 → Phase 2: Stall has been open at least 60–90 days with consistent order volume, menu and pricing are stable (not still being adjusted weekly), and Halal/licensing is fully resolved and stable.
- Phase 2 → Phase 3: Loyalty data shows a measurable increase in repeat-customer rate or referral-driven growth. If loyalty doesn't move the needle, building games on top of it won't fix that — the underlying incentive design needs revisiting first.

If you skip these gates and build all three phases at once, the realistic outcome for a solo no-code builder is a delayed opening, an over-engineered site with no usage data to justify it, and reward economics set by guesswork rather than evidence.

6. User Personas

Persona	Description	Primary Needs
Walk-in Customer	Local Penampang resident or passer-by, decides on the spot.	Fast menu browsing, clear pricing, easy ordering at the counter or via QR.
GrabFood / Delivery Customer	Orders remotely, price-sensitive to delivery mark-ups.	Consistent menu info between GrabFood and the MunchiesKK site.
Returning / Loyal Customer (Phase 2+)	Has ordered before, motivated by rewards.	Visible points balance, meaningful rewards, simple referral sharing.
Ali (Founder / Admin)	Runs the stall solo with two staff, manages the site solo with no-code tools.	Fast stock/price updates, simple order visibility, minimal maintenance overhead.

7. Phase 1 (MVP) Feature Specifications

7.1 HOME — Mainpage

- Hero section with brand name, tagline ('Made With Love To Satisfy Your Hunger'), and a hero image or short looping food video.
- Primary call-to-action: 'View Menu' / 'Order Now'.
- Store info block: address (Penampang), operating hours, contact/WhatsApp link, GrabFood link.
- Announcement banner slot for daily specials or temporary closures.

7.2 MENU — Food / Drinks / Desserts (Customer-Facing)

- Three categories: Food (Big G, Mushy2, CZ Chix burgers + fries variants), Drinks (blended and canned), Desserts.
- Each item shows name, price (walk-in vs. GrabFood price clearly labelled if different), short description, and photo.
- Out-of-stock items are automatically hidden or shown greyed-out — driven by the back-end stock toggle in 7.3.
- Add-to-cart / order flow appropriate to whichever platform is chosen (see Section 11 for no-code ordering options).

7.3 MENU — Lightweight Back End for Stock & Pricing

The original request called for a 'CRM.' For a single-location solo operation, a full CRM is over-scoped. What's actually needed in Phase 1 is a simple admin panel:

- Toggle any item In Stock / Out of Stock in under 10 seconds.
- Edit price per item (walk-in and GrabFood price separately).
- Add/remove items and categories without needing a developer.
- Basic daily order count and top-seller view — not a full sales-analytics suite.

True CRM functionality (customer segmentation, marketing automation, multi-location inventory) is not needed for one stall and should not be built in Phase 1. Revisit only if MunchiesKK expands to multiple locations.

7.4 PROFILE (Phase 1 scope)

Sub-feature	Phase 1 status	Notes
Personal Info	Included	Name, phone, address for delivery/pickup.
Order History	Included	List of past orders, status, reorder button.
Payment Methods	Included (basic)	Saved payment method reference via whatever gateway is chosen (Section 10.3); no in-house card storage.
Promo Codes	Included	Simple code entry at checkout; codes managed manually by Ali.
Settings / Logout	Included	Notification preferences, account deletion, logout.
Current Points	Deferred to Phase 2	Shown as 'Coming Soon' placeholder in Phase 1.

8. Phase 2 Feature Specifications — Loyalty Points

Do not design final tier thresholds or reward values until Phase 1 has produced at least 60–90 days of real order data. The numbers below are placeholders to be validated, not final specs.

8.1 Current Tier

- Points earned per Ringgit spent (rate to be set from real margin data, not guessed).
- Tiers (e.g., Bronze / Silver / Gold) unlock perks like free add-ons or early access to new menu items.
- Tier progress bar visible in Profile.

8.2 Prize Vault

- Catalogue of redeemable rewards (free fries, free drink upgrade, discount vouchers).
- Each reward's point cost must be checked against actual margin — giving away high-margin items protects profitability better than giving away signature burgers.

8.3 Point History

- Chronological ledger: points earned per order, points redeemed, expiry (if any) clearly dated.

8.4 Referral

- Unique referral code/link per customer.
- Reward triggers only on referred customer's completed first order (not on sign-up) to avoid abuse.
- Cap on referral rewards per customer per month to control cost.

9. Phase 3 Feature Specifications — Arcade & Gamification

This is the highest-effort, highest-risk part of the original vision, and the one most likely to be genuinely difficult to build without code. Treat the three 'games' below as placeholders for lightweight mechanics, not as commitments to build real video games.

Slot	Recommended lightweight mechanic	Why not a 'real' game
Game 1	Daily spin-the-wheel for bonus points (visual wheel, weighted odds).	Buildable with no-code interactive tools; no real-time gameplay logic needed.
Game 2	Scratch-card reveal for a random small reward on order completion.	Single-interaction reveal animation; low build complexity.
Game 3	Simple quiz/trivia about the menu ('Guess the burger') for bonus points.	Static content-driven, no physics or game engine required.

True interactive games (matching, runner, puzzle games with real-time logic) generally require actual code (JavaScript/game engine) — this is realistically outside a no-code solo build. If the founder still wants real games at this stage, budget for hiring a developer specifically for this phase rather than attempting it solo.

9.1 Points Integration

- All Arcade rewards pay out in the same points currency as Section 8 — no separate parallel currency.
- Daily play caps per mechanic to prevent points-farming and protect reward economics.

10. Cross-Cutting Requirements

10.1 CRM / Admin Scope Boundary

Reiterating Section 7.3: Phase 1 needs a stock/price admin panel, not a CRM. If a genuine CRM (customer segmentation, campaign automation) is wanted later, evaluate it as its own initiative once there's a customer list worth segmenting.

10.2 Stock Management

- Manual toggle is sufficient at one location with two staff — do not build automated inventory forecasting for Phase 1.
- Sync consideration: if using GrabFood in parallel, stock toggles must be updated in both places until/unless a connector exists between the chosen no-code platform and GrabFood (verify this before assuming automatic sync).

10.3 Payments (Malaysia context)

- Preferred: DuitNow QR and FPX online banking — widely supported by Malaysian no-code/e-commerce platforms and familiar to local customers.
- Cash-on-pickup should remain an option for walk-in customers regardless of site capability.
- Do not build a custom payment processor — use an established gateway (e.g., a Malaysian payment aggregator supported by the chosen platform).

10.4 Compliance Gating

The website should not go live for real transactions until SSM registration and the MPP Penampang trading licence are confirmed, and Halal certification status is clearly and truthfully reflected on the site (do not display a Halal badge until certification is actually granted — this is a legal and reputational risk, not a cosmetic detail).

11. Technical Approach for a Solo No-Code Build

Given the founder is building this solo without code, platform choice matters more than feature ambition. The recommendation below is scoped to what Phase 1 actually needs.

Layer	Recommended approach	Notes
Website + ordering (Phase 1)	No-code storefront platform with built-in ordering and local-payment support (e.g., a Shopify-, Wix-, or WooCommerce-based storefront, or a Malaysia-focused F&B; ordering SaaS).	Choose based on which supports DuitNow/FPX out of the box and has the lowest ongoing learning curve for a solo, non-technical builder.
Stock/price admin (Phase 1)	Built-in admin panel of whichever platform is chosen above.	Avoid a separate CRM tool in Phase 1 — one system, one login.
Loyalty (Phase 2)	Loyalty app/plugin compatible with the chosen Phase 1 platform.	Confirm plugin compatibility before Phase 1 platform is finalised, to avoid a platform migration later.
Arcade (Phase 3)	No-code interactive/quiz-builder embed, or a hired developer for true game mechanics.	See Section 9 — set expectations before committing to a platform.

11.1 A Note on Platform Lock-In

Pick the Phase 1 platform partly based on whether it can plausibly support Phase 2's loyalty needs without a full rebuild. Migrating platforms after launch means re-training staff, re-entering the menu, and risking downtime during business hours — worth an hour of research before committing.

12. Risks, Assumptions & Open Questions

Risk	Impact	Mitigation
Halal certification delayed past opening	High — affects credibility with a large segment of the local customer base	Do not display Halal claims until certified; treat as a hard blocker for any marketing that implies certification
Solo no-code builder underestimates Phase 1 build time	Medium — risks delaying Aug 2025 opening	Scope Phase 1 strictly to Section 7; resist adding Phase 2/3 features early
GrabFood pricing/menu drifts out of sync with website menu	Medium — customer confusion, pricing disputes	Establish a single source of truth (the admin panel in 7.3) and manually mirror to GrabFood until/unless a sync integration exists
Loyalty reward economics set before real margin data exists	Medium — could erode margin	Hold Phase 2 launch until the Section 5.2 gate criteria are met
Arcade games are more technically demanding than a no-code build can deliver	Medium — wasted effort or a stalled Phase 3	Use the lightweight mechanics in Section 9, or budget for a developer if true games are wanted

12.1 Open Questions

- Which no-code platform will be finalised for Phase 1, and does it natively support DuitNow/FPX?
- Will GrabFood remain the only delivery channel, or are others (e.g., Foodpanda) planned?
- What is the actual budget ceiling if a developer needs to be brought in for Phase 3?
- Who handles day-to-day admin-panel updates if Ali is unavailable — is a staff member being trained as backup?

13. Roadmap & Timeline

Milestone	Target window	Depends on
Finalise no-code platform + payment gateway	Now – 2 weeks before opening	Section 11 decision
Build & test Phase 1 (Home, Menu, Profile, Admin panel)	Ongoing, complete before opening	Menu/pricing already locked — no blocker
Phase 1 launch	August 2025	SSM, trading licence, food handler cert, Halal status per Section 10.4
Collect 60–90 days of order data	Aug–Nov 2025	Phase 1 live
Design & build Phase 2 (Loyalty)	Following data review	Gate criteria in Section 5.2
Evaluate Phase 2 impact on repeat-customer rate	~30–60 days post Phase 2 launch	Sufficient loyalty usage data
Design & build Phase 3 (Arcade) — only if justified	Only if Phase 2 shows measurable lift	Gate criteria in Section 5.2

14. Appendix — Menu Reference

For reference only — final pricing lives in the Phase 1 admin panel (Section 7.3), not in this document, so it never goes stale.

Category	Items
Burgers	Big G, Mushy2, CZ Chix
Fries	Three variants (regular / flavoured — confirm final names in admin panel)
Drinks	Blended drinks, canned drinks
Desserts	Confirm final line-up in admin panel

End of document. Recommended next step: confirm the Section 11 platform choice, then build strictly to the Section 7 Phase 1 scope.
